

Formally, an iterable is "an object capable of returning its members one at a time". Some data types we have studied are iterables, as you can see in the slide below. Strings and lists and tuples are iterables. And later on you will study Dictionaries (you can iterate over their keys and their corresponding values).

## What is an iterable?

According to Python's glossary:

An object capable of *returning its members one at a time*

**You can find more on iterables in Python's documentation:**

<https://docs.python.org/3.6/glossary.html>

But this concept seems so abstract, right? "Capable of returning its members one at a time" What does this mean?

**Iterables' magic comes to life in for loops.** Why? Because they return their elements one at a time on every iteration.

This is better illustrated with an example to describe the required syntax:

## Iterables in Action!

As you can see, we have a general syntax for using iterables in for loops. But how does this work? What does it do? What will be printed?

Let's examine this in more detail:

Iterables return their elements one at a time. *This means that on every iteration of the for loop, the variable located after the "for" keyword and before the "in" keyword*

## Examples

```
for i in ['Baby', "Dog", 15, [1, 2, 3]]:
    print(i)
```

```
for i in (3, 4, 5, 6, 8):
    print(i)
```

```
for i in 'MITx 6.00.1x':
    print(i)
```

General syntax:

```
for variable_used_inside_loop in iterable_object:
    # Do something
```

This variable will take the value of the corresponding element in iterable\_object on every iteration

will take the value of an item returned by the iterable. Eventually, when the “for loop” stops executing, this variable will have had as values all the elements in the iterable.

This can be illustrated with an example:

## Example 1

```
for i in ['Baby', "Dog", 15, [1, 2, 3]]:
    print(i)
```

Loop iteration	Value of i
1 <sup>st</sup>	'Baby'
2 <sup>nd</sup>	'Dog'
3 <sup>rd</sup>	15
4 <sup>th</sup>	[1, 2, 3]

```
>>> for i in ['Baby', "Dog", 15, [1, 2, 3]]:
    print(i)
Baby
Dog
15
[1, 2, 3]
```

```
for element in ['Baby', "Dog", 15, [1, 2, 3]]:
    print(element)
```

As you can see, the for loop returns the elements in the list from left to right, one at a time on every iteration of the for loop.

The variable before the “in” keyword will take the value of the element returned, **BUT ONLY ON ITS CORRESPONDING ITERATION**. You can think of this process as if the value of i resets after every iteration and another value is assigned to it.

**NOTE:** It is important to note that you can name the variable before the “in” keyword anything you’d like. For example, in the slide above we named it “element”. The important fact is to understand that this variable will hold the corresponding value for each iteration and you can use the variable inside the loop.

Here you can see that strings are also iterables, but in this case, their elements are their characters (Like the grid system we studied during String Slicing). On every iteration, the string will return a character from left to right until the variable i has been assigned all the characters in the string.

### Example 2

```
for i in 'MITx 6.00.1x':  
    print(i)
```

Loop iteration	Value of i
1st	'M'
2nd	'I'
3rd	'T'
4th	'x'
5th	' '
6th	'6'

```
>>> for i in 'MITx 6.00.1x':  
    print(i)  
  
M  
I  
T  
x  
  
6  
.0  
0  
.1  
x
```

```
for char in 'MITx 6.00.1x':  
    print(char)
```

This process continues until all letters have been evaluated, that is why I use an ellipsis to highlight that the process doesn't end at the last step shown.

Here you can see that tuples are iterables as well.

**IMPORTANT:** It is important to highlight that the variable before the “in” keyword

## Example 3

```
for i in (3, 4, 5, 6, 8):
    print(i)
```

Loop iteration	Value of i
1 <sup>st</sup>	3
2 <sup>nd</sup>	4
3 <sup>rd</sup>	5
4 <sup>th</sup>	6
5 <sup>th</sup>	8

```
>>> for i in (3, 4, 5, 6, 8):
    print(i)
3
4
5
6
8
```

```
for num in (3, 4, 5, 6, 8):
    print(num)
```

should be descriptive of a general property of the values it will hold if there is a pattern in the data type elements.

For example, if we have a list of animals, our variable could be names “animal” since it will hold an animal species.

It is also very important to mention that **the iterable object can be assigned to a variable** before even using it in the “for loop”. In this case, we simply replace the iterable by the variable it’s assigned to.

```
for animal in ["Zebra", "Wildebeest", "Cheetah", "Fennec"]:
    print(animal)
```

The variable's name can be descriptive of the elements in the iterable object

```
>>> for animal in ["Zebra", "Wildebeest", "Cheetah", "Fennec"]:
    print(animal)
Zebra
Wildebeest
Cheetah
Fennec
```

```
animals = ["Zebra", "Wildebeest", "Cheetah", "Fennec"]
for animal in animals:
    print(animal)
```

The iterable can be previously assigned to a variable and used in the for loop

```
>>> animals = ["Zebra", "Wildebeest", "Cheetah", "Fennec"]
>>> for animal in animals:
    print(animal)
Zebra
Wildebeest
Cheetah
Fennec
```

Hope it helps!

If you have any question, please post them in the forums or right below this post, your classmates and Community TAs will always be on the forums to help! :-)

Great explanation. I am impressed !!

posted 4 months ago by [tech1trans](#)

Can you make it into a pdf format and attach it in the downloaded document or link to it for downloading ?

posted 4 months ago by [tech1trans](#)

Thank you very much, I'm very glad it helped 🙌 If you are using google chrome, you can save it using the "print" function and save it as a PDF.

Nice source, the official python site. That is a keeper. Intelligent use of color scheme is something I appreciate about that tutorial. It is something color monitors allow us to experience and we should not be taking those pixels for granted when optimizing a digital environment for learning. Have you tried sct for screen temp? Its a great little program.

Thank you very much for these explanations. My English is not a native language. I can't understand the content of the video very well. But these illustrations really help me master the knowledge.

This was really helpful, coming from other languages I always associated the variable in the for loop as a counter and not actually taking on the elements of the data structure. That has been tripping me up for awhile and is taking some time to get used to.
